React Native - Tips para reducir el tamaño del apk

<https://medium.com/@aswinmohanme/how-i-reduced-the-size-of-my-react-native-app-by-86-27be72bba640>

Reducing size of React Native App (Android)

This is what you have been waiting for, I know.

- Open up `android/app/build.gradle`
- Set `def enableProguardInReleaseBuilds = true` this would enable Proguard to compress the Java Bytecode. This reduces the app size by a tad bit
- Set `def enableSeparateBuildPerCPUArchitecture = true`. Android devices support two major device architectures `armeabi` and `x86`. By default RN builds the native libraries for both these architectures into the same apk.

Setting the last function creates two distinct apks in the build folder. You have to upload both of these apks to Play Store and Google would take care of distributing the app to the correct architectures.

Using this split generates version numbers for both apks in the order of 104856 and such. This is auto-generated by the build to avoid version conflicts, so don't freak out (I did).

This split reduced the apk size from around 7MB to 3.5MB for `arm` and 5MB for `x86` respectively.

Cómo crear íconos de apps con Image Asset Studio

React Native - Agregar Splash Screen

<https://www.netguru.com/codestories/react-native-splash-screen>

<https://www.npmjs.com/package/react-native-splash-screen>

<https://github.com/crazycodeboy/react-native-splash-screen>

```
@Override
protected void onCreate(@Nullable Bundle savedInstanceState) {
    SplashScreen.show(this, R.style.SplashScreenTheme, true); // <- here
    super.onCreate(savedInstanceState);
}
```

React Native - javaMaxHeapSize

```
# android/app/build.gradle
dexOptions {
    javaMaxHeapSize "4g"
}

# android/gradle.properties
org.gradle.jvmargs=-Xmx4608M
```
